The Beauty and Joy of Computing

Lecture #6 Algorithms I

Ethical trap: robot paralysed by choice of who to save

http://www.newscientist.com/article/mg22329863.700#VCBKo6x0z6E

What is an algorithm?

- An **algorithm** is any well-defined computational procedure that takes some value or set of values as input and produces some value or set of values as output.

- The concept of algorithms, however, is far older than computers.

UC Berkeley "The Beauty and Joy of Computing": Algorithms I (2)

Friedland + Kotker

Early Algorithms

- Dances, ceremonies, recipes, and building instructions are all conceptually similar to algorithms.
- Babylonians defined some fundamental mathematical procedures ~3,600 years ago.
- Genes contain algorithms!

Algorithms You've Seen in CS10

- Length of word
- Whether a word appears in a list
- Interact with the user (ask)
- Word Comparisons (You wrote one for HW1!)
- Sort a List (see lab!)
- Make this a block!

Friedland + Kotker

Algorithms You Might Have Heard Of

Luhn algorithm
Credit card number validation

Deflate
Lossless data compression

PageRank
Google's way of measuring "reputation" of web pages

EdgeRank
Facebook's method (ca. 2010) for determining what is highest up on your news feed

Announcements: Quest

- Wednesday, October 1.
- Short exam in class.
- Questions are mostly multiple-choice, circle the correct answer, indicate what happens, predict the output, and so on.
- Quest is a sanity check – if you have been showing up to lectures, labs and discussions, and you understand the overall concepts, you should be fine. If you do not understand something, *please ask for help*. The staff is always willing to help. ☺

UC Berkeley "The Beauty and Joy of Computing": Algorithms I (6)

Friedland + Kotker

Important Terms

<p>Sequencing Application of each step of an algorithm in order (sometimes: find order)</p>	<p>Selection Use of Boolean condition to select execution parts</p>
<p>Iteration Repetition of part of an algorithm until a condition is met</p>	<p>Recursion Repeated application of the same part of algorithm on smaller problems</p>

UC Berkeley "The Beauty and Joy of Computing": Algorithms I (7)

Properties of Algorithms

- Algorithm + Algorithm = Algorithm
- Part of Algorithm = Algorithm
- Algorithms can be efficient or inefficient given a comparison algorithm
- Several algorithms may solve the same problem

UC Berkeley "The Beauty and Joy of Computing": Algorithms I (8)

Algorithm Correctness

We don't only want algorithms to be fast and efficient; we also want them to be **correct!**

<p>TOTAL Correctness Always reports, and the answer is always correct.</p>	<p>PARTIAL Correctness Sometimes reports, and the answer is always correct <i>when it reports</i>.</p>
---	---

We also have *probabilistic* algorithms that have a certain *probability* of returning the right answer.

UC Berkeley "The Beauty and Joy of Computing": Algorithms I (9)

How to Express Algorithms...

A programmer's spouse tells him: "Run to the store and pick up a loaf of bread. If they have eggs, get a dozen." The programmer comes home with 12 loaves of bread.

Algorithms need to be expressed in a context-free, unambiguous way for all participants.

UC Berkeley "The Beauty and Joy of Computing": Algorithms I (10)

Ways to Express Algorithms

- Natural Language
- Pseudo Code
- Programming Language
- ...or in any other information conveying way!

```

Pseudo Code
1) initialize ports
   PA6-PA7 inputs
   PA7 output
2) turn off solenoid
3) set counter to 4000
4) repeat indefinitely
   if switch matches key
     a) decrement counter
     b) if counter is zero
        turn on solenoid
   otherwise
     a) turn off solenoid
     b) set counter to 4000
C/C++
DDRA=0x20;
PORTA=0; cnt=4000;
while(1){
  if((PORTA&0x7F==key){
    if(cnt==0){
      PORTA|=0x30;
    }
    else{
      PORTA=0; cnt=4000;
    }
  }
}
  
```

UC Berkeley "The Beauty and Joy of Computing": Algorithms I (11)

Programming Languages

<p>C/C++ Good for programming that is close to hardware</p>	<p>Java/C# Portable code</p>
<p>Python/Perl/Tcl/TK Fast to write and portable</p>	<p>BASIC/BYOB/SNAP Good for teaching programming concepts</p>

All programming languages can be used to implement (almost) any algorithm!

UC Berkeley "The Beauty and Joy of Computing": Algorithms I (12)

Choosing a Technique

- Most problems can be solved in more than one way, i.e., multiple algorithms exist to describe how to find the solution.
- The right language makes formulating algorithms easier and clearer.
- Not all of these algorithms are created equal. Very often we have to make some trade-offs when we select a particular one.
- There are unsolvable problems!

Algorithms vs. Functions and Procedures

- Algorithms are conceptual definitions of how to accomplish a task and are language agnostic, usually written in pseudo-code.
- A function or procedure is an implementation of an algorithm, in a particular language.
- Find max value in list
 - Set (a temporary variable) the max as the first element
 - Go through every element, compare to max, and if it's bigger, replace the max
 - Return the max

Summary

- The concept of an algorithm has been around forever, and is an integral topic in CS.
- Algorithms are well-defined procedures that can take inputs and produce output. Programming languages help us express them.
- We're constantly dealing with trade-offs when selecting / building algorithms.
- Correctness is particularly important and testing is the most practical strategy to ensure it.
 - Many write tests first!
